INITIAL VISIT WORKSHEET

Refer to Appendices A and B in *Guidelines and Resources for the Depression Nurse Specialist.*

To: *(Primary care clinician)* _____ **Today's date:** ___/___/___

Mr./Ms. _____ *(Study ID _____, MR# _____)* has been identified by the Partners in Care study team to have symptoms of depression. S/he attended an initial educational session on ____/____/____ and *(has / has not)* received the video tape and educational brochure in *(English / Spanish)*. Refer to step-by-step guide for Depression Nurse Specialist's initial visit assessment (Appendix A) and Depression Nurse Specialist initial assessment queries (Appendix B) in *Guidelines and Resources for the Depression Nurse Specialist.*

List 2 questions for the doctor or primary care clinician:

1. _____
2. _____

Symptoms *(Check all that apply, then circle the symptom that bothers the patient the most)*

- ❑ ✣ Sad or empty ✣
- ❑ ✣ Loss of interest ✣
- ❑ Poor concentration
- ❑ Poor energy
- ❑ Worthless/guilty
- ❑ Anxiety
- ❑ Hopelessness/poor future
- ❑ Drinks alcohol *(type(s)* _____ *drinks/day* _____*)*
- ❑ Thoughts of suicide or self-harm
- ❑ Sleep disturbance *(sleeps ____ hrs/night)*
- ❑ Appetite/weight change *(+ / - ___ lbs.)*
- ❑ Physical agitation or slowness
- ❑ Periods of over-excitement
- ❑ Sees/hears things not apparent to others
- ❑ Drug misuse/abuse
- ❑ Family history of depression
- ❑ Somatic/Other symptoms: *(list)*
  _____
  _____
  _____
  _____
  _____

NOTE: *The patient meets DSM-IV* major depression *criteria IF at least 5 of the 9 symptoms shown in the outlined box are present nearly every day for 2 weeks or more,* ***and*** *one of these symptoms is marked by a ✣ ✣. (Dysthymia has fewer/milder symptoms and lasts for 2 years or more.)*

Other Indicators for Depression:

(c h e c k a l l t h a t a p p l y)

a. Beck score: _____ **b.** Activities affected: ❑ social ❑ personal ❑ family ❑ work/school

c. Patient last felt good ___ *(wks / mos)* ago **d.** # bed days last month ____ **e.** # restricted days last month ____

Treatment:

a. Patient treated for depression *in the past?* ❑ Yes ❑ No ***Treated currently?*** ❑ Yes ❑ No

a.1 Any of these treatments? *(✓ if yes)* ❑ Psychotherapy ❑ Medication ❑ Electro-Convulsive Therapy

a.2 Was/is treatment helpful? ➔ ❑ Yes ❑ No ❑ Yes ❑ No ❑ Yes ❑ No

b. Patient wants: ❑ medication ❑ psychotherapy ❑ no strong preference

c. Patient is opposed to: ❑ medication ❑ psychotherapy ❑ no strong opposition

Current Medications

List both prescription & non-prescription medications

(Circle medications which may interact significantly with antidepressants)

Your Personal Plan: Medications

INFORMATION ABOUT ANTIDEPRESSANT MEDICATIONS

How do antidepressants work?

Both life stresses and medical problems can deplete the amount of chemical messengers in the nervous system that maintains the balance in how you feel emotionally and physically. This chemical imbalance results in some of the common symptoms of depression such as sleep and appetite problems, loss of energy, loss of concentration, and increased sensitivity to pain. Antidepressant medications help restore a normal balance of these chemical messengers, which helps to relieve emotional and physical symptoms.

Antidepressants can take up to 6 weeks to work. It usually takes one to four weeks until people start feeling better emotionally and physically. The improvement may be gradual, and oftentimes family members or friends may notice a difference in how you are doing before you do. Your sleep and appetite may improve first, then your mood and energy. Negative thinking may take some more time to decrease.

Once you are feeling better, do not stop the medication right away. Your doctor may recommend taking the medication for six to nine months or longer to prevent a relapse of the depression.

How to find an antidepressant that works for you?

Scientific studies show that antidepressant medications do not differ in the percentage of patients that get better. However, different medications are effective for different people, and the side effects of the medications differ. Some medications also cost more than others. Your doctor can help you decide which medication may be best for you.

About 70% of patients will get better after 4 to 6 weeks on an antidepressant medication. By working together, you and your doctor can decide during that six-week period whether the medication you started is the right one for you. If you need to switch to another antidepressant because of side effects or because you are not significantly improved after six weeks, chances are still excellent that you will improve on this second medication.

What about side effects?

Some people may experience side effects when taking antidepressant medications. While these side effects can be annoying, they are rarely dangerous to your health. They usually occur in the first few weeks and then gradually decrease as your body adapts to the medication. Because of these early side effects, patients sometimes feel a little worse before they start getting better and may give up too soon. If you have side effects that are bothering you, discuss these with your doctor. Your doctor will help you determine if these side effects will decrease over time or if you should decrease or switch your medication.

Some of the side effects that can occur with antidepressants:

- nausea
- headaches
- jitteriness
- weight gain
- diarrhea
- insomnia
- sedation
- urinary hesitancy
- dizziness
- rapid heart rate
- temporary difficulty in achieving orgasm
- blurred vision
- dry mouth
- constipation
- *other:* _____

Remember:

- Antidepressants are not addicting or habit forming. They do not make people 'high', and they do not lead to serious withdrawal symptoms once you stop them.
- Take the medications daily.
- Keep track of side effects and problems and discuss them with your physician.
- **Do not stop the medication before talking with your doctor.**
