PREFACE

The Rand Corporation prepared this report for the Health Services Administration and Human Resources Administration of New York and the Office of Economic Opportunity to document the Population Health Survey of 1969-70 (referenced as 1970). This codebook with marginals (frequency of responses by question) is the first publication of most of the content of this survey. It lists the survey questions, their valid codes on magnetic tape, and the frequency of each code.

Although much more sophisticated analyses of the data will be performed, this simple codebook constitutes a basic reference work on the health conditions and use of health care facilities in New York City. It should be useful both to future users of the original data files and to persons who want to perform immediate analyses. It should be especially useful to those who must quickly assess general health conditions within the City and patterns of facility utilization.

Other reports in this series are *Population Health Surveys 1964, 1965, and 1966: Codebook and Marginals*, R-1161-NYC/OEO, and *Population Health Survey 1968: Codebook and Marginals*, R-1096-NYC/OEO, both by Jan Paul Acton, Lindy J. Clark, and Robert J. Young.

SUMMARY

The Population Health Survey of New York City was conducted for five separate years: 1964, 1965, 1966, 1968, and 1969-70 (referenced as 1970). It was originally sponsored by the City Department of Health and later by the Health Services Administration (HSA). The Survey Research Center of the City University of New York performed most of the field work and coding, using cluster sampling in five New York City boroughs.

This report lists, in abbreviated form, the questions that were asked and the frequency of coded responses for the Population Health Survey of New York City residents in 1969-70. The questions dealt chiefly with health conditions and use of health services, although there are also questions on many relevant sociodemographic characteristics of the respondents. Approximately 516 "columns" of information are available on 13,356 respondents. The codebook gives the meaning and frequency of responses to questions that are on magnetic tape. The marginals are not weighted in this report, although the weight column remains on the tape. No comprehensive listing of the frequency of responses has previously been made available to current research efforts.

This work is designed to facilitate future analyses of the data as well as to provide a ready reference for rapid overviews of the status of health conditions and the use of existing services.

Rand acquired these surveys through HSA on the condition that the authors clean up the data files and return edited copies of the tapes along with documentation. Editing the data required converting alphabetic and other multiple punches into single-punch codes. It also required deleting duplicated data and adding cards to each record so that all records are the same length.

Rand will use these codebooks, primarily those for 1968 and 1969-70, and their corresponding data files as part of its continuing analysis (1) of the demand for health care (both for HSA and the Office of Economic Opportunity) and (2) of the health problems and their

relation to welfare dependency among the City's poor (for the Human Resources Administration). Specifically, Rand will create models of the demand for health care, and then estimate the magnitude of the services needed by using multiple regression techniques.

ACKNOWLEDGMENTS

Irv Leveson of the Health Services Administration of New York City was instrumental in acquiring this data file and generous with support. Mort Israel of the Survey Research Center, City University of New York, was helpful on many occasions in clarifying mysterious coding. We appreciate both contributions very much.

I. INTRODUCTION

The Population Health Survey of New York City was conducted for five separate years: 1964, 1965, 1966, 1968, and 1969-70 (referenced as 1970).^{*} It was originally sponsored by the City Department of Health and later by the Health Services Administration (HSA). The Survey Research Center of the City University of New York performed most of the field work and coding, using cluster sampling in five New York City boroughs.

Rand will use these codebooks, primarily those for 1968 and 1969-70, and their corresponding data files as part of its continuing analysis (1) of the demand for health care (both for HSA and the Office of Economic Opportunity) and (2) of the health problems and their relation to welfare dependency among the City's poor (for the Human Resources Administration). Specifically, Rand will create models of the demand for health care, and then estimate the magnitude of the services needed by using multiple regression techniques.

For the 1969-70 survey, 13,356 individuals are recorded. Originally there were 9 cards per person plus an additional 1 to 7 cards, depending on the number of physician and hospital visits a person may have made. After editing, the logical record length per person is 516. The editing consisted of deleting duplicated data and adding 7 additional cards to each record so that all records are the same length. The tape positions indicated in the codebook are for the edited tape. Since completion rate was not uniform by types of respondents, the Survey Research Center created weights that attempt to correct for the differences. We have left the weight value on the tape, but the marginals are not weighted.

In the codebook, the first column indicates the tape position for a given question in the edited tape. The "ORIGINALLY DECK #"

^{*} Besides this 1969-70 codebook, surveys for the other years are reported in *Population Health Surveys 1964, 1965, and 1966: Codebook and Marginals*, R-1161-NYC/OEO, and *Population Health Survey 1968: Codebook and Marginals*, R-1096-NYC/OEO.

entry refers to the deck (00, 10, 20, ..., 80, 22, ..., 25, 52, 53, 54) as originally punched on cards. "QUES." is the question number given in the original survey instrument. "COLUMN LABELS & CODE MEAN-
ING" is a short form of the question posed to respondents; for complete wording, the user should consult the original instruments.*

"CODE" is the actual numeric code on magnetic tape after editing; abbreviations used are NA for not answered, DK for didn't know, and BK for blank and generally means not applicable. The column headed "%" indicates the percentage of responses for the code on that line. Similarly, "N" is the number of such responses. The total N for each question (including BK, NA, and DK) should be 13,356.

In the original data many of the columns of each deck were supposed to be identical for an individual. After running checks on the columns, we found that some numbers were off slightly, but not significantly. The marginal percentages stayed the same, but the absolute number of the various codes was periodically off by one or two.

The appendix provides a record of the editing performed on the original tape.

*To obtain these, contact the Survey Research Center of the City University of New York.
