The Effects of a Universal Preschool Program in California

Estimates for the Central Coast Region

Policy makers and the public are interested in the potential costs and benefits of making high-quality preschool available to all children at some point before kindergarten entry. In a prior study, RAND researchers estimated that a high-quality, one-year, voluntary, universal preschool program in California could generate for California society $2.62 in benefits for every dollar of cost. For each annual cohort of four-year-olds (approximately 550,000 children), the study estimated that California society would receive $2.7 billion in present-value net benefits.1

Benefits for each cohort of four-year-olds were also estimated in nonmonetary terms. These benefits include nearly 14,000 fewer children ever retained in grade; 9,100 fewer children ever using special education; 10,000 fewer high-school dropouts; 4,700 fewer children with a substantiated case of abuse or neglect; and 7,300 fewer children with a juvenile petition (i.e., a juvenile arrest that leads to a court filing). These results assume that 70 percent of the four-year-olds, or 385,000 children, participate in the preschool program.

These estimates pertain to the state of California as a whole. We report here a follow-up study in which the statewide analysis was extended to generate estimates at a more localized level. Specifically, the study estimated the effects of a high-quality, one-year, universal preschool program for the largest California counties and for several groups of California counties. Estimated effects included reductions in grade repetition, use of special education, high-school dropout rate, child abuse and neglect, and juvenile crime.

Key findings:

If a high-quality, universal preschool program for four-year-olds were implemented in the Central Coast region, each annual cohort of participants would realize the following benefits, among others, over the course of their childhood and adolescent years:

- 570 fewer children ever retained in grade
- 2,600 fewer child-years of special education
- 410 fewer high-school dropouts
- 200 fewer children ever abused or neglected
- 1,200 fewer juvenile petitions in court.

These reductions range from 5 to 28 percent of what would occur without the universal preschool program. The improvements are associated with substantial financial benefits to California taxpayers, preschool participants, and California society at large.

1 An annual cohort is the set of all children of the same age. Present value is the worth of a projected stream of benefits after discounting those accruing in the future by a certain percentage (e.g., 3 percent per year). Discounting is necessary to reflect people’s preference for near-term benefits over long-term benefits.
Approach

The county-level estimates of the effects are based on an extension of the methodology employed in RAND’s statewide analysis. The approach assumes a high-quality preschool program available to all California four-year-olds on a voluntary basis. Class size, staff-to-child ratio, and teacher qualifications are assumed to be consistent with research-based quality standards. Notably, these standards exceed those required for public preschool programs in California, such as Head Start and the California state preschool program. (If a less expensive program with lower standards were implemented, it is reasonable to suppose that benefits would be smaller than those cited here.)

The disaggregated analysis accounts for population size differences across California counties as well as differences in the size of the at-risk population and in current preschool participation rates. County-level data are drawn from a variety of sources including California Department of Finance population projections; census data on preschool participation rates; and other California data on baseline education, child abuse and neglect, and juvenile crime.

To determine which effects would be realized by a universal preschool program and the magnitude of those effects, RAND drew upon scientific evidence of the effects of high-quality preschool on disadvantaged children. The effects measured in the scientific studies were adjusted downward to account for the broader population of children served and for benefits received by those children already attending quality preschool programs. The adjustment factor varied for each county and county group, depending on county income levels and current preschool participation rates.

Findings

The Central Coast region is projected to have an average of about 27,000 four-year-olds each year over the next decade. The table shows the improvements in measures of education, abuse and neglect, and juvenile crime that the Central Coast region can expect for each cohort of four-year-olds that would participate in the program. (Results are also shown for California as a whole.) Each of these outcomes is a cumulative measure, capturing changes for each annual cohort of participants from the end of preschool to age 18. For example, if the 27,000 four-year-olds participate in a high-quality, universal preschool program at a 70-percent rate, almost 400 fewer children will ever use special education as they work their way through elementary, middle, and high school.

The benefits would be realized at different times in the future. The grade-retention and special-education improvements can occur throughout the K–12 years, while the reduction in dropouts is realized at approximately age 18, i.e., 13 years after the universal preschool program ends. Likewise, most of the juvenile crime improvements will be realized during the adolescent years.

NOTE: Effects are those of a high-quality, one-year, universal, voluntary preschool program.

To put into perspective the size of these effects for the Central Coast region (and California as a whole), the figure shows the estimated improvements in percentage terms, relative to a baseline that measures what the outcomes would have been in the absence of a universal preschool program. The percentage effects were calculated for seven of the nine measures. (Such estimates were not possible for grade repetition and violent juvenile crime because of data limitations.) For example, the reduction of almost 400 children who ever use special education represents 5–7 percent of the total number of such cases as projected without the universal preschool program. The range (5–7 percent) reflects different assumptions used to derive the baseline level.

The Central Coast region has a relatively low share of four-year-olds in the highest-risk group. Hence, the resulting percentage effects shown in the figure are generally more attenuated than for the state as a whole. Two notable exceptions to this pattern are the percentage changes in high-school dropouts and child-years of education, which are among the largest estimated: a 28 and 42 percent change, respectively. The large percentage effects for these two outcomes result from the fact that Ventura County and the other larger counties in the Central Coast region have very low reported four-year high-school dropout rates. It is very likely that the differences in these rates, and hence the reported percentage effects in the figure, are the result, in part, of anomalies in the way the dropout rates are computed at the county level.

The report also provides estimates for Ventura County, the largest county in the region. Generally, as seen in the second table, the results are similar to those for the Central Coast county group,

2 The adjustments are required because the universal program will serve many children who are not disadvantaged and will thus not stand to gain as much as those in the scientific studies. Also, those studies typically compare preschoolers with children not attending preschool, whereas in California, many children are already in preschool, and will thus not gain as much from a new, universal program.
including the exceptionally high percentage effects for the high-
school dropout and child-years of education outcomes.

While some of the improvements may appear to be modest in
percentage terms, it is important to note that they are associated
with substantial financial benefits that accumulate with the passage
of time. The earlier statewide RAND study estimated, for example,
that each year of special-education use that is avoided saves Califor-
nia taxpayers $8,421. An average high-school graduate, compared
with an average high-school dropout, earns an additional $132,000
(present value) by age 65. The California public sector benefits from
the higher lifetime earnings in the form of higher tax revenue of
more than $5,000 (present value) for each additional high-school
graduate. In addition, a typical case of child maltreatment that is
prevented saves $5,174 in California public-sector funds plus an
additional $5,079 in tangible costs to victims. Finally, each juvenile
petition that is avoided saves California taxpayers an average of
$9,204 in costs through the juvenile justice system and $12,873
in tangible victim costs. These figures for child maltreatment and
juvenile crime do not account for any intangible victim costs (e.g.,
pain and suffering). Furthermore, the crime costs do not account
for any subsequent lifetime savings to the criminal justice system
and crime victims as a result of preventing adult crime.

The estimates presented above for the Central Coast region and
for California are subject to several sources of uncertainty. While
the study did not calculate error bands around the estimates, the
estimates should be viewed as approximations of the expected size
of the effects.

Despite the uncertainty in the estimates, the county-level results
presented here can provide relevant local perspective for public and
private decisionmakers considering investments in a high-quality,
universal preschool program in California. The findings provide a
sense of the likely magnitude of the benefits of universal preschool
in terms of key measures of the well-being of children, measures
that also have favorable economic consequences for the public sec-
tor and for private individuals.
