Ending Social Promotion in New York City Public Schools Without Leaving Children Behind

Educators struggle with how best to handle students whose academic performance does not reflect readiness for the next grade by the end of the school year. While retaining these students in grade gives them an additional year to master the knowledge and skills for that grade, critics point out that the practice disproportionately affects low-income and minority children and is associated with low self-esteem, problem behaviors, and an increased risk of dropping out of school. However, promoting students who do not meet academic standards—also known as “social promotion”—puts students at a disadvantage by advancing them to a grade for which they are not prepared.

As part of an ambitious reform initiative, the New York City Department of Education (NYCDOE), the largest school district in the country, implemented a new promotion and retention policy for students in grade 3 during the 2003–2004 school year. The policy was extended to grade 5 in 2004–2005, grade 7 in 2005–2006, and grade 8 in 2008–2009. Under the policy, general education students in these grades are required to score at or above Level 2 on a four-level performance scale on the state English language arts and mathematics assessments in order to be promoted to the next grade. Performance at or above Level 3 is considered “proficient” under the No Child Left Behind Act and is a higher standard than the promotion benchmark.

NYCDOE’s policy is noteworthy in that it emphasizes identifying struggling students early; providing them with support services, such as additional instructional time; and continuously monitoring their progress. Under the policy, at-risk students are identified—based on their performance on the previous year’s assessments, teacher recommendations, or being previously retained in grade—and scheduled to receive support services in and outside of school. Students who do not pass the spring assessments are enrolled in summer school. The policy also offers students multiple opportunities to meet promotion criteria.

From March 2006 through August 2009, RAND researchers analyzed the impact of NYCDOE’s policy on student outcomes, focusing on three cohorts of 5th-grade students held to the policy and one pre-policy comparison cohort. Using interviews, case studies, student surveys, and demographic and test score data, the researchers examined the implementation of NYCDOE’s grade promotion and retention policy and its impact on student academic and socioemotional outcomes over time.

Few Students Were Retained Under the Policy

Overall, approximately 75 percent, or 60,000, 5th-grade students were held to the promotion policy in each of the three cohorts. About 20 percent of those students were categorized as need-
ing services upon entering the 5th grade. At the beginning of
the year, more students needed services in English language
arts than in mathematics, but by the end of the year, students
were more likely to be retained for failing to meet promotion
criteria in mathematics. Few students were retained under
the policy, and the percentage of retained students dropped
over time, from 2–3 percent in the first two cohorts to 1 per-
cent in the third cohort (about 600 students out of approxi-
mately 58,000 students).

Supports Provided Under the Policy Helped
Students Meet Promotion Standards
The study found that the policy had positive effects on the
achievement of in-need students during the 5th-grade year.
The effects were stronger in English language arts than in
mathematics. However, for the small group of students enter-
ing 5th grade with the lowest scores on the state assessments,
additional promotion policy services during the school year
had little effect on performance. More frequent attendance
at Saturday classes and summer school was associated with
greater improvements in mathematics performance.

The Positive Effects of the Policy Continued into
Later Grades
The study’s findings showed that components of the promo-
tion policy had positive effects for students that lasted into
the 6th and 7th grades, including small, positive effects from
erly identification and intervention; small, positive effects
from summer school; and moderate, positive effects from an
additional year of instruction due to retention.

Retained Students Did Not Report Negative
Socioemotional Effects
The responses to student surveys indicated that retention did
not have negative effects on students’ sense of school belong-
ing or confidence in mathematics and reading, even three
years after being retained in grade. While this is counterin-
tuitive, it is consistent with some prior studies.

School Staff Tended to Be Positive About the Policy
In surveys and interviews, principals and teachers were
positive about many aspects of the promotion policy; the
majority agreed that the policy helped focus their schools’
instructional efforts and made parents more aware of their
children’s progress. However, the majority of respondents
thought that the promotion policy relied too heavily on state
assessment scores and, interestingly, that the policy made
it more difficult to retain students who would benefit from
being retained but had passed the test.

Several Policy Recommendations Emerge from
the Findings
The study’s findings led to the following recommendations
for policymakers and administrators. While targeted to New
York City, these recommendations may also apply to other
districts and states considering or implementing test-based
promotion policies.

• Continue early identification of students and provision of
academic intervention services. The findings suggest that early
identification and support services helped students meet
promotion standards and improved student achievement in
future grades. One-on-one tutoring was particularly helpful
and should be continued and expanded when possible.

• Consider the expected duration and participation when
designing Saturday programs. The researchers found that
attending at least seven sessions was associated with improved
performance in mathematics. Thus, principals need to con-
sider expected student attendance and program length before
investing in such programs.

• Continue to encourage struggling students to attend summer
school. Summer school attendance appeared to have a positive
relationship with student achievement, particularly in math-
ematics, and summer school may also have a positive impact
on future achievement in grades 6 and 7.

• Analyze student-level data to evaluate the effectiveness of
specific interventions provided to struggling students. The study
highlighted several instructional strategies that can help low-
performing students. It is important to systematically collect
and analyze data to determine each strategy’s effectiveness.

• Continue to monitor the longer-term effects of retention on
students. Two of the most important questions are whether
the short-term positive effects of the policy persist over the
longer term and whether the policy is cost-effective, com-
pared with alternatives. This study could not answer those
questions, but they remain important topics for New York
City to address in the future.
