This product is part of the RAND Corporation technical report series. Reports may include research findings on a specific topic that is limited in scope; present discussions of the methodology employed in research; provide literature reviews, survey instruments, modeling exercises, guidelines for practitioners and research professionals, and supporting documentation; or deliver preliminary findings. All RAND reports undergo rigorous peer review to ensure that they meet high standards for research quality and objectivity.
A Review of the Army’s Modular Force Structure

Stuart E. Johnson, John E. Peters, Karin E. Kitchens, Aaron Martin, Jordan R. Fischbach

Prepared for the Office of the Secretary of Defense

Approved for public release; distribution unlimited

The research described in this report was prepared for the Office of the Secretary of Defense (OSD). The research was conducted within the RAND National Defense Research Institute, a federally funded research and development center sponsored by OSD, the Joint Staff, the Unified Combatant Commands, the Navy, the Marine Corps, the defense agencies, and the defense Intelligence Community under Contract W74V8H-06-C-0002.
Congress has taken great interest in the capabilities of the U.S. Army as the service has transitioned to its new, modular force structure. Congress recently requested an independent study to determine

(A) The operational capability of the Army to execute the core mission of the Army to contribute land power to joint operations.
(B) The ability to manage the flexibility and versatility of Army forces across the range of military operations.
(C) The tactical, operational, and strategic risk associated with the heavy, medium, and light modular combat brigades and functional support and sustainment brigades.
(D) The required and planned end strength of the Army.\(^1\)

This study addressed these questions through comparative analysis, considering how the earlier, division-centric force structure compared to the current force structure. Many of the data to support the analysis were provided by the Army. In particular, the U.S. Army Training and Doctrine Command’s Army Capabilities Integration Center provided Army Structure Messages that allowed us to track changes in the Army’s force structure between 2003 and 2008, the period when much of the transition to the current modular force structure was taking place. The research team also made use of the Army’s Structure and Manpower Allocation System (SAMAS) database and FMSWeb for data on manpower and organizational characteristics of the force.

We concluded that the present force structure is superior to the earlier force structure in terms of its ability to contribute land power to current and reasonably foreseeable joint operations, its flexibility and versatility across the range of military operations, and its associated risks. The analysis also demonstrated that the modular force structure produced a larger tactical force with a larger number of more aggregated capabilities than its predecessor force structure.

Several insights from the analysis are worth special mention here. First, the Army’s longstanding practice of task organization (the process whereby senior commanders temporarily attach some of their units to subordinate commanders to execute a given mission) is not a symptom of flaws in the Army’s organizational design. Rather, it is a practice that allows a commander to tailor the force to the specific requirements of a given operation. For example, a commander might strip units from a subordinate commander who has a relatively easier

task in the operation and assign them to another subordinate who faces more demanding
tasks. Task organization is a practice that contributes to the Army’s flexibility and versatility,
allowing it to adapt to changing circumstances.

Second, larger headquarters at the BCT, division, and corps levels are not in themselves
signs of bloat. They too contribute to the force’s flexibility and versatility because their size
allows them to operate around the clock. They have more senior noncommissioned officers
(NCOs) and field-grade officers than was the case in earlier headquarters designs, which
enables better planning and wider spans of control (that is, the headquarters can effectively
employ and control a larger number of subordinate maneuver units and integrate enabling
organizations). Furthermore, senior NCOs and officers can be deployed to command company
teams, battalion task forces, and other ad hoc organizations that allow the BCT, division, or
corps to respond to unexpected challenges (or opportunities).

Third, the current force structure has been developed for current operations. It is very dif-
ferent in design from the forces that the Army organized to oppose the Soviet Western Group
of Forces, but that adversary no longer exists. The current force structure provides “overmatch”
(overwhelming advantages) against today’s foes. Moreover, the process of adapting and adjust-
ing the Army’s fielded forces continues. In this regard, the move to the current force structure
should not be viewed as revolutionary; it really reflects long-standing Army practices of react-
ing to changed circumstances by updating its forces and their organization, doctrine, and
equipment.

Finally, concerns have been expressed regarding the absence of a third maneuver battal-
ion in the heavy and infantry BCTs. The Army has been aware, almost from the beginning of
the move to the brigade-centric force, of the limitations that the missing maneuver battalion
imposes on the force, and it has crafted compensating tactics, techniques, and procedures.
Former BCT commanders with whom we spoke would surely prefer a third maneuver bat-
talion, but none believed that the two-battalion organization has led to greater risk in current
operations. If circumstances changed and more capable adversaries appeared, the Army could
reorganize to provide a smaller number of larger, three-battalion BCTs with the same end
strength if it concluded that doing so would provide a clear advantage.
