LABOR AND POPULATION

PREFACE

This codebook describes the content and structure of the Neighborhood Observations that were conducted in 2000 and 2001 as part of Wave 1 of the Los Angeles Family and Neighborhood Survey. The Los Angeles Family and Neighborhood Survey (L.A.FANS) is a longitudinal study of families and neighborhoods in Los Angeles County that also collected detailed individual and household data.

L.A.FANS Neighborhood Observations were completed for 422 Census blocks in 65 Census tracts in Los Angeles County. Census blocks were the smallest geographic unit sampled for L.A.FANS, and all households selected for the study resided in one of these Census blocks. Neighborhood observations were completed for each face and any alleys in the Census block by trained interviewers. For each block an average of three independent observations were completed by separate interviewers.

The L.A.FANS Neighborhood Observations data are part of the L.A.FANS Restricted Data because information in these data files may enable deductive identification of survey respondents. These data will be provided to researchers who submit a research proposal and data protection plan that are approved by RAND. The L.A.FANS Restricted Data Access Policy (see <http://www.lasurvey.rand.org/policyver1.htm>) describes the process that requestors must follow.

The forms and instructions for the L.A.FANS Neighborhood Observations are available in the following document:

Sastry, Narayan, and Anne R. Pebley (2004), *The Los Angeles Family and Neighborhood Survey: Neighborhood Observation Forms and Interviewer Manual*, Report DRU-2400/6-1-LAFANS, Labor and Population Program, RAND Corporation, available at <http://www.rand.org/pubs/drafts/DRU2400.6-1/DRU2400.6-1.pdf>.

The L.A.FANS Neighborhood Observations data are being released on an “as-is” basis as a public service to the research community. L.A.FANS project staff will not provide advice on analytic or data reduction strategies for these data, except for the advice provided in this codebook.

ACKNOWLEDGMENTS

The L.A.FANS Neighborhood Observations were designed and conducted under the direction of Narayan Sastry and Anne R. Pebley. The L.A.FANS Neighborhood Observations forms and instructions were developed with input from Robert J. Sampson (while at the University of Chicago) and Tama Leventhal (while at Columbia University), and drew on materials developed for the Project on Human Development in Chicago Neighborhoods. David Kurth (while at RAND) helped to finalize the instruments and write the interviewer instructions. Rachel Veerman (RAND and UCLA) provided administrative support.

Fieldwork was conducted by the Survey Research Group (SRG) at RAND, under the direction of Jennifer Hawes-Dawson. Other key SRG participants included Sandra Berry, Shirley Nederend, and Judy Perlman. SRG field supervisors included Marianella Alvarez, Vesta Budhu, Maria Johnson, Crystal Kollross, Sandra Paffen, and Audrey Tatum.

Primary funding for L.A.FANS-1 and the collection of the L.A.FANS Neighborhood Observations data was provided by the National Institute for Child Health and Human Development through grants R01 HD35944 and R01 HD41486. Additional funding was provided by the Office of the Assistant Secretary for Planning and Evaluation (OASPE) of the U.S. Department of Health and Human Services, Los Angeles County, the Office of Behavioral and Social Science Research (OBSSR) at the National Institutes of Health, and the Russell Sage Foundation. The project is very grateful to these sponsors for their financial support throughout the design, planning, and conduct of L.A.FANS.

GLOSSARY

Symbol	Definition
Alley	A drivable passageway which usually bisects a Census block and provides access to the rear of properties that run along a block face
Block Face	Both sides of the street along one side of a block
Census Block	The smallest geographic unit used by the U.S. Census Bureau. A Census block usually corresponds to a city block.
L.A.FANS-1	Wave 1 of the Los Angeles Family and Neighborhood Survey

1. OVERVIEW OF THE L.A.FANS NEIGHBORHOOD OBSERVATIONS

The Los Angeles Family and Neighborhood Survey (L.A.FANS) is a longitudinal study of families in Los Angeles County and of the neighborhoods in which they live. A total of 65 neighborhoods throughout Los Angeles County were sampled for L.A.FANS. Information about these 65 neighborhoods comes from a variety of sources, including respondent reports about their own neighborhoods as well as neighborhood-level summaries based on weighted averages of respondent reports,¹ a database of neighborhood services and characteristics developed from census and administrative files,² and neighborhood observations conducted by trained field interviewers.

The aim of the L.A.FANS Neighborhood Observations was for the interviewers to record the physical and social characteristics for each of the 422 Census blocks in the 65 Census tracts that were selected for the L.A.FANS sample. Direct observation of the neighborhood by trained interviewers allowed the project to collect this information in a systematic and standardized manner. A small team of interviewers completed most of the L.A.FANS Neighborhood Observations. This approach promoted the standardization of observations across different types of neighborhoods throughout Los Angeles County and also allows researchers to examine, and control for, the possible presence of idiosyncratic interviewer-specific effects in completing the neighborhood observations.

The L.A.FANS Neighborhood Observations asked interviewers to record their observations about the physical characteristics as well the social characteristics of the neighborhood. Physical characteristics include the type and condition of buildings, lots, public areas, streets, and sidewalks; the presence of trash and litter, abandoned cars, graffiti, and odors; the types of commercial activity and public transportation; and the level of security or protection for properties in the neighborhood. Social characteristics include the types of people who were seen in the neighborhood, including police or security personnel, children, teenagers, adults, and the homeless, and the types of activities that people were engaged in or reported in the block, such as prostitution, drinking or drug activity, gang activity, and begging.

¹ See Peterson, Christine E., Narayan Sastry, Anne R. Pebley, Bonnie Ghosh-Dastidar, Stephanie Williamson, and Sandraluz Lara-Cinisomo (2003), *The Los Angeles Family and Neighborhood Survey: Codebook*, Report DRU-2400/2-LAFANS, Labor and Population Program, RAND Corporation.

² See Christine E. Peterson, Anne R. Pebley, and Narayan Sastry (2007), *The Los Angeles County Neighborhood Services and Characteristics Database*, Report WP-240/12-LAFANS, Labor and Population Program, RAND Corporation.

The L.A.FANS Neighborhood Observations were completed systematically and quickly. Interviewers would begin by driving around the entire block. They would then walk along each block face, carefully observing the physical and social characteristics and recording their impressions when they reached the end of each block face. A “block face” is both sides of the street along one boundary of the Census block, and, thus, in general corresponds to both sides of the street along one edge of a city block—such as the portion of Pico Boulevard between 16th and 17th Streets. More information on the definitions and interviewer instructions for completing the L.A.FANS Neighborhood Observations are available in the following document:

Sastry, Narayan, and Anne R. Pebley (2004), *The Los Angeles Family and Neighborhood Survey: Neighborhood Observation Forms and Interviewer Manual*, Report DRU-2400/6-1-LAFANS, Labor and Population Program, RAND Corporation, available at <http://www.rand.org/pubs/drafts/DRU2400.6-1/DRU2400.6-1.pdf>.

The L.A.FANS Neighborhood Observations forms were completed by trained interviewers. For most blocks neighborhood observations were completed independently by three interviewers, although 29 blocks had four independent reports, three blocks had five independent reports, and one block had six independent reports. Information is recorded on the time and date that each observation was completed so that observations conducted at the same time by different interviewers can be compared. The L.A.FANS Neighborhood Observations were conducted between April 2000 and July 2001, with the majority being done in April and May of 2000 (27%) and in April and May of 2001 (63%).

The L.A.FANS Neighborhood Observations data are **restricted**, rather than publicly available, because the data files identify the specific Census blocks and tracts in the L.A.FANS sample. Information on blocks and tracts in the sample may enable the identification of L.A.FANS respondents. Researchers who would like to use the L.A.FANS Neighborhood Observations data must submit a research proposal and a data safeguarding plan to RAND. Please see the L.A.FANS website (www.lasurvey.rand.org) for further information about obtaining L.A.FANS Restricted Data. Note that the L.A.FANS Neighborhood Observations data are only available to users who are approved for Restricted Data Version 2.5 or Version 3.

Please Note: The L.A.FANS Neighborhood Observations data are being released on an “as-is” basis as a public service to the research community. As described below, these data can be complex to use because they involve a variable number of block faces per block, multiple blocks per Census tract, and variable numbers of potentially discrepant observations of each block face. Decisions on how to combine data for each block and tract must be made *by each data user*. L.A.FANS project staff will not provide advice on analytic or data reduction strategies for these data, except for the advice provided in this codebook. However, if you develop a strategy for summarizing variables that are part of the data and would like to share this information with other users, the L.A.FANS project will consider distributing your code or guidelines along with the L.A.FANS Neighborhood Observations data to approved Restricted Data users.

2. GENERAL CHARACTERISTICS OF THE L.A.FANS NEIGHBORHOOD OBSERVATIONS DATA

L.A.FANS Neighborhood Observations were completed for each of the 422 Census blocks in the sample. A mean of 2.9 independent observations was completed for each Census block, with a minimum of two separate observations and a maximum of six. Note that for a few Census blocks, neighborhood observations were not completed for all of the block faces.

The number of block faces per Census block varied between 1 and 36, with a mean of 4.8. In some Census blocks, particularly those in outlying low-density areas, the configuration of streets did not correspond to a square city block. Instead, these Census blocks had a large number of block faces, and there are some discrepancies among interviewers in identifying separate block faces. In particular, some interviewers treated a single block face that spanned several cross streets as multiple separate block faces—of these cases, certain interviewers assigned the same block face number to each of the segments while others gave each segment a unique block face number. These cases can be resolved by noting that, in general, segments on a single side of a Census block have the same block face number. However, there are some cases where the block face segments do not have the same block face number, in which case it is observations with the same street name that represent a given block face.

There is variation in the coding of neighborhood observations for the same block face by different interviewers. Although subjective differences in how each interviewer perceives the neighborhood were reduced by providing standardized training and clear instructions for completing the forms, these differences may still be present. Another reason for variation in coding is that interviewers often completed their observations at different times of the day, days of the week, or months of the fieldwork period. While the first two neighborhood observation were generally completed within a two-week period, the third and subsequent observations were likely to be done a month or more later—with many of them being done six or more months later. Users are cautioned to pay attention to differences in observations of the same block by date it was completed.

3. DESCRIPTION OF DATA FILES

The L.A.FANS Neighborhood Observations database comprises three separate data files, corresponding to the cover page, the physical and social block observations, and the alley observations. In this section, we list the variables that uniquely identify each block face and describe procedures for linking data for the same block face across the three files. We also provide a brief overview of the structure and contents of the three data files, NOBSCOV_V2, NOBSBLK_V2, and ALLEY_V2, including a list of the variables in each file and, for each variable, whether it is numeric or character, the maximum number of possible digits or characters, and a short description. Appendix A presents frequencies for all variables in each of the three data files.

The data files are available in the following file formats: SAS UNIX, SAS export, and STATA. Due to limitations in SAS, the export format files have file names and variable names with a maximum of 8 characters. This resulted in two changes to file names in the SAS export files (nobscov_v2 is changed to nobscov2 and nobsblk_v2 to nobsblv2) and several changes to variable names (DID_ALLEY is changed to DIDALLEY, MULTALLEY to MULTALLY, DID_BLOCKOBS to DIDBLKOB, and DID_SOCOBS to DIDSOCOB). Also available are two separate files with the variable formats, one for SAS and one for STATA.

IDENTIFIERS AND LINKING DATA

Each record in the L.A.FANS Neighborhood Observations database is defined by the variable BOOKLET, which corresponds to a unique combination of the Census block code and the interviewer's ID. (Each record can also be uniquely identified by a combination of the variables TRACTH90, BLOCKH90, and INTID.)

For each block, the variables TRACTH90 and BLOCKH90 provide the 1990 Census tract and block codes. The variable BLKFACE identifies unique block faces within each Census block. All observations by different interviewers for the same block face within a Census block will have the same BLKFACE value. For cases where an interviewer divided a Census block face into multiple segments, the variable SEGMENT identifies each segment within the block face. The variable STNAME is the name of the street serving as a boundary of the Census block. The variables STREET1 and STREET2 are used to identify the beginning and ending intersections along the boundary street STNAME that define the Census block face (or the segment, if the block face was subdivided by the interviewer).

The variable ALLEY_ID was created to identify each alley in blocks with multiple alleys. Most blocks with alleys had just a single alley. In blocks with multiple alleys, it was not always straightforward to match records for the same alley because interviewers used different descriptions or names to describe the alleys.

All components of the L.A.FANS Neighborhood Observations data collected by an interviewer for a specific Census block will share the same BOOKLET value. Thus, if a data user wants to add cover page data to the block observation data, he or she would use the variable BOOKLET to merge the two data files.

The L.A.FANS Neighborhood Observations data can be linked to the L.A.FANS-1 household survey data by creating summary measures of the former at the level of the Census block or tract. This requires that, for each block or tract, individual neighborhood observations records be aggregated, combined, or summarized across all block faces and across multiple interviewers to yield one record per TRACTH90/BLOCKH90 combination or one record per TRACTH90 value. The TRACTH90/BLOCKH90 combination should be used to merge summary L.A.FANS Neighborhood Observations data at the block level data to individual or household records, and the TRACTH90 variable should be used to merge tract-level summaries of the L.A.FANS Neighborhood Observations.

Each data user must determine the appropriate level of spatial aggregation to use and the specific algorithm to combine data from multiple block faces and multiple interviewers. Note that L.A.FANS project staff will not provide advice on how to combine these data into block or tract level variables for use with the L.A.FANS individual household data, since these are individual user decisions.

NOBSCOV_V2: NEIGHBORHOOD OBSERVATIONS COVER FILE

The NOBSCOV_V2 file contains one record for each value of the variable BOOKLET, which is defined by unique combinations of Census block (BLOCKH90) and interviewer ID (INTID). The file contains information collected on the cover page of the L.A.FANS Neighborhood Observations instrument booklet. There are 1,238 records and 29 variables in the NOBSCOV_V2 file. Records with the same values for the combination of variables TRACTH90 and BLOCKH90 represent observations on the same Census block. Table 1 lists the contents of the NOBSCOV_V2 file, including the variable name, type (character or numeric), length, and description.

Table 1. Contents of the Neighborhood Observations Cover File (NOBSCOV_V2)

Variable	Type	Len	Label
TRACTH90	Char	11	1990 Census tract
BLOCKH90	Char	5	1990 Census block
INTID	Num	3	INTERVIEWER IDENTIFIER
NBLOCK	Num	2	NUMBER OF BLOCK/SOCOBS FORMS
NALLEY	Num	1	NUMBER OF ALLEY FORMS

COV4_2	Num	2	VISITED BLOCK ON: WEEKEND DAYS
COV4_3	Num	2	VISITED BLOCK ON: WEEKEND EVENING/NIGHT
COV5	Num	2	ANYTHING AFFECTED HOW YOU FILLED FORM

NOBSBLK_V2: NEIGHBORHOOD PHYSICAL AND SOCIAL OBSERVATIONS FILE

The NOBSBLK_V2 file has one record for each block face observation and contains the information collected on the block physical and social characteristics observation forms. Because more than one interviewer observed each block face, there are multiple observations per block face. Moreover, as described above, the number of observations per block face varies from block face to block face. A block face observation is uniquely defined by the combination of TRACTH90/BLOCKH90/BLKFACE/BOOKLET/SEGMENT. There are 5,966 records and 187 variables in the NOBSBLK_V2 data file.

Records with the same TRACTH90/BLOCKH90/BLKFACE combination represent observations on the same block face. Of the 2,071 block faces, 24 have two segments, one has 3 segments, and one has 5 segments.

Table 2 list the contents of the NOBSBLK_V2 data file, including the variable name, type (character or numeric), length, and description.

Table 2. Contents of the Block Physical and Social Observations File (NOBSBLK_V2)

Variable	Type	Len	Label
TRACTH90	Char	11	1990 Census tract
BLOCKH90	Char	5	1990 Census block

ALLEY_V2: ALLEY OBSERVATIONS FILE

The ALLEY_V2 data file has one record for each unique alley observation and contains the information collected on the alley observation form. Unique alley observations are defined by the combination of variables TRACTH90/BLOCKH90/BOOKLET/ALLEY_ID. There are a total of 199 alleys among the Census blocks in the L.A.FANS sample. Only 144 of the Census blocks had alleys and most Census blocks had only a single alley. The mean number of observations per alley was 2.3. There are 460 records and 25 variables in the ALLEY_V2 data file.

Records with the same combination of TRACTH90/BLOCKH90/ALLEY_ID represent observations on the same alley. Note that the ALLEYNAM variable is often uninformative and does not always follow the naming guidelines described in the manual, especially when there was more than one alley in a block. STREET1 and STREET2 were intended to provide beginning and ending cross-streets for the alley. These variables are not always correct because interviewers sometimes had difficulty describing alleys, especially when there were multiple alleys in the same block. The variable ALLEY_ID was created from the variables ALLEYNAM, STREET1, and STREET2 after fieldwork was completed. Although we believe that we have properly identified multiple observations on the same alley, there may be errors in blocks with more than one alley.

These errors will not have an effect for data users who are creating summary measures at the block or tract level, but will affect users interested in comparing observations of the same alleys by different interviewers.

Table 3 lists the contents of the ALLEY_V2 data file, including the variable name, type (character or numeric), length, and description.

Table 3. Contents of the Alley Observations File (ALLEY_V2)

Variable	Type	Len	Label
TRACTH90	Char	11	1990 Census tract
BLOCKH90	Char	5	1990 Census block
INTID	Num	3	INTERVIEWER ID
NALLEY	Num	1	NUMBER OF ALLEYS OBSERVED
BOOKLET	Char	4	BOOKLET ID NUMBER
ONEALLEY	Num	1	BLOCK HAS ONLY 1 ALLEY LISTED
MULTALLEY	Num	1	BLOCK HAS MORE THAN 1 ALLEY LISTED
ALLEY_ID	Num	1	ALLEY ID NUMBER WITHIN BLOCK
ALLEYNAM	Char	19	ALLEY NAME/DESCRIPTION
STREET1	Char	19	BETWEEN STREET/LANDMARK 1
STREET2	Char	19	AND STREE/LANDMARK 2
DID_ALLEY	Num	1	ALLEY FORM STARTED FOR THIS ALLEY
ALLEY1	Num	2	# OF HOUSES W/MAIN ENTRANCES ON ALLEY
ALLEY2	Num	2	# OF BUSINESES W/MAIN ENTRANCE ON ALLEY
ALLEY3	Num	2	IS ALLEY LOCKED-DOWN
ALLEY4	Num	2	RATE CONDITION OF STREET SURFACE
ALLEY5	Num	2	ARE THERE ABANDONED CARS IN ALLEY
ALLEY6	Num	2	IS THERE TRASH OR JUNK IN ALLEY
ALLEY7	Num	2	IS THERE GARBAGE, LITTER, BROKEN GLASS
ALLEY8	Num	2	ARE THERE DRUG-RELATED PARAPHERNALIA
ALLEY9	Num	2	ARE THERE BEER/LIQUOR CONTAINERS
ALLEY10	Num	2	ARE THERE CIGARETTES/CIGAR BUTTS/PCKGS
ALLEY11	Num	2	IS THERE GRAFFITI ANYWHERE
ALLEY12	Num	2	IS THERE PAINTED-OVER GRAFFITI
ALLEY13	Num	2	ARE THERE OBVIOUS STRONG ODORS ANYWHERE

**APPENDIX A. FREQUENCIES FOR L.A.FANS
NEIGHBORHOOD OBSERVATIONS VARIABLES**

This appendix presents the univariate frequencies for all variables in the three L.A.FANS Neighborhood Observations data files: NOBSCOV_2, NOBSBLK_V2, and ALLEY_V2.

**FREQUENCIES FOR VARIABLES IN NEIGHBORHOOD OBSERVATIONS COVER
FILE (NOBSCOV_V2)**
